# WEEKLY HEALTH REPORT

## NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. Troops in transit and certain small detachments are not required to submit reports; for this and other reasons, total strength of reporting units has been consistently about 1 percent below the actual strength of the Army in this country. The mean strength shown for individual stations is that of Army personnel attached or assigned for medical care and does not include organizations not on the post but dependent on the station for hospitalization.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

### MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or longer, except for certain cases carded for record only (chiefly venereal disease cases treated on a duty status, and deaths which occurred before admission to hospital or quarters). Admissions designated as "injury" comprise all traumatisms other than battle casualties (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications as well as various types of wounds not due to enemy action). Under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties. All cases other than those of injury or battle casualty are classified as "disease." The presence of Ports of Embarkation and of large numbers of casualties admitted should be borne in mind in making comparisons between Service Commands and individual stations.

Admission rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The average proportion of the daily strength of the command which is confined to hospital or quarters (mean number of non-effectives per thousand strength) is given in the summary table for the total United States and for each of the Service Commands. This ratio may not be significant when the strength of a Command is changing markedly or when a Command has a relatively large number of General Hospitals.

The number of enlisted men discharged during the week on Certificates of Disability for Discharge (CDD) are shown for individual stations. These data should be distinguished from the figures for "honorable discharges for physical and mental disqualification" assembled by The Adjutant General's Office; the latter include discharges for inaptness in addition to CDD's and are tabulated on a somewhat different basis (e.g., the April data represent April discharges processed by the AGO during April and May plus discharges prior to April which were processed in May).

### MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 15 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

### STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

### HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of total beds authorized, total beds occupied, and the percent of total beds authorized which are occupied.

Total beds authorized are those defined in par. 36h of AR 40-1080, Changes No. 2 and No. 3 and do not include beds in dispensaries, convalescent facilities, venereal disease facilities and college or university training units.

Regional Hospitals are distinguished from Station Hospitals by the letters (RH) appearing after the name of the station. Likewise Convalescent Hospitals are denoted by the letters (CH).

In the case of General Hospitals there are shown, in addition, the number of Army patients admitted, the number disposed of during the week (by return to duty, transfer, death, CDD, or otherwise), and the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, subdivided by disease, injury, and battle casualty patients. The patient days of treatment are presented separately for hospital and for convalescent facilities. The bed capacity and beds occupied in convalescent facilities are also indicated.

### EXPLANATORY MATTER

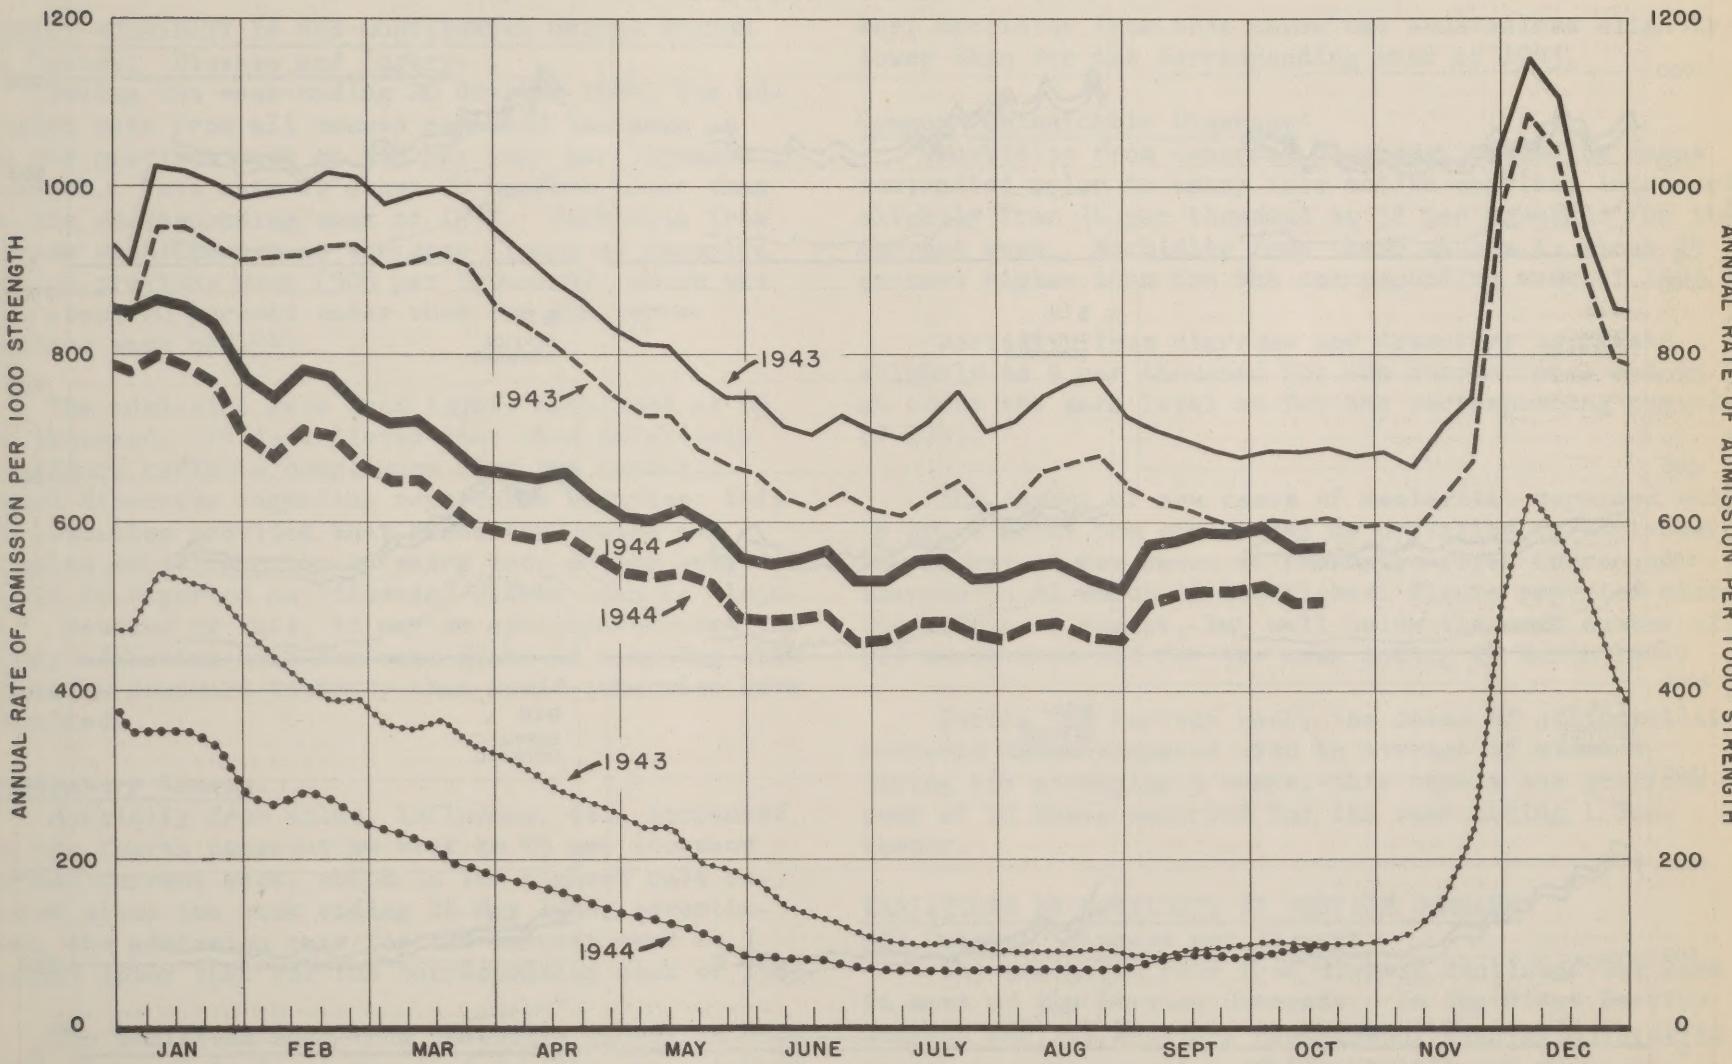

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station have not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

## VARIATIONS BY SERVICE COMMAND

CONTINENTAL UNITED STATES

## WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 20 OCTOBER 1944

## COMMENT ON CURRENT TRENDS

## CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

All Causes: Disease and Injury:

During the week ending 20 October 1944, the admission rate from all causes remained the same as for the previous week or 570 per year per thousand strength. This rate is about 20 percent lower than for the corresponding week of 1943. Morbidity from disease was likewise at the same figure as reported for the previous week (505 per thousand), which was also about 20 percent under that for the corresponding week of 1943.

The admission rate from injury continued at 65 per thousand. It is believed that this relatively low figure reflects compliance with the recently issued directive regarding reportable injuries; this clarification provided that readmitted cases and injuries existing prior to entry into active service should be reported as "disease" rather than as "injury." Because of this, it may be anticipated that the injury admission rate for some weeks to come may show more of a downward tendency than would otherwise have prevailed.

Respiratory Causes:

Morbidity from colds, influenza, etc. increased for the fourth consecutive week to 95 per thousand for the current week, which is the highest rate reported since the week ending 26 May 1944; nevertheless, the admission rate for the current week is 7 percent lower than for the corresponding week of 1943.

The admission rate from pneumonia increased from 7 per thousand to 9 per thousand for the current week and was also at the highest point since the end of

May; morbidity from this cause was nonetheless slightly lower than for the corresponding week of 1943.

Common Communicable Diseases:

Morbidity from venereal diseases, excluding cases contracted prior to entry into active service, increased slightly from 36 per thousand to 38 per thousand for the current week. Morbidity from these causes is about 35 percent higher than for the corresponding week of 1943.

Morbidity from diarrhea and dysentery decreased slightly to 9 per thousand for the current week and is at about the same level as for the corresponding period of 1943.

The number of new cases of meningitis reported was 18 or at about the same level as prevailed in September. The number of new cases of rheumatic fever increased sharply to 61 which is the highest figure reported since the middle of August, but well below the peak number of 229 cases reported for the week ending 24 March 1944.

During the current week, the cases of poliomyelitis numbered 12 as compared with an average of about 8 during the preceding 5 weeks; this equals the previous peak of 12 cases reported for the week ending 1 September.

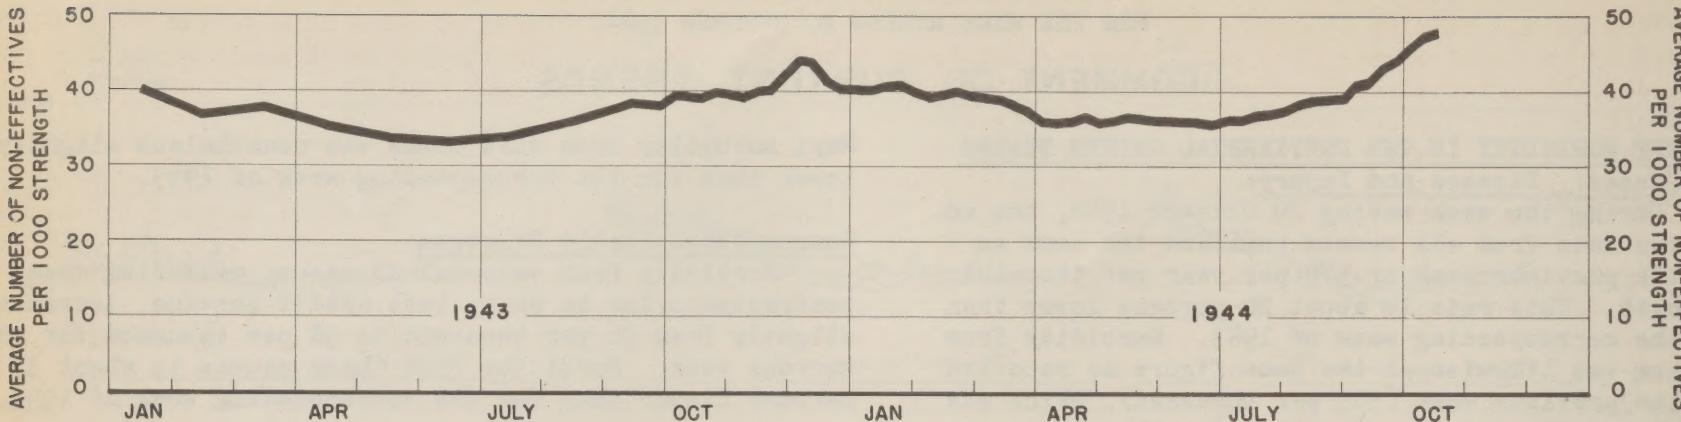

## VARIATIONS IN MORBIDITY BY SERVICE COMMAND

All Causes: Disease and Injury:

The admission rate from disease continued the same in most of the Service Commands. In the First Service Command and the Military District of Washington sizable decreases were recorded, while significant increases were reported in the Third and Fifth Service Commands.

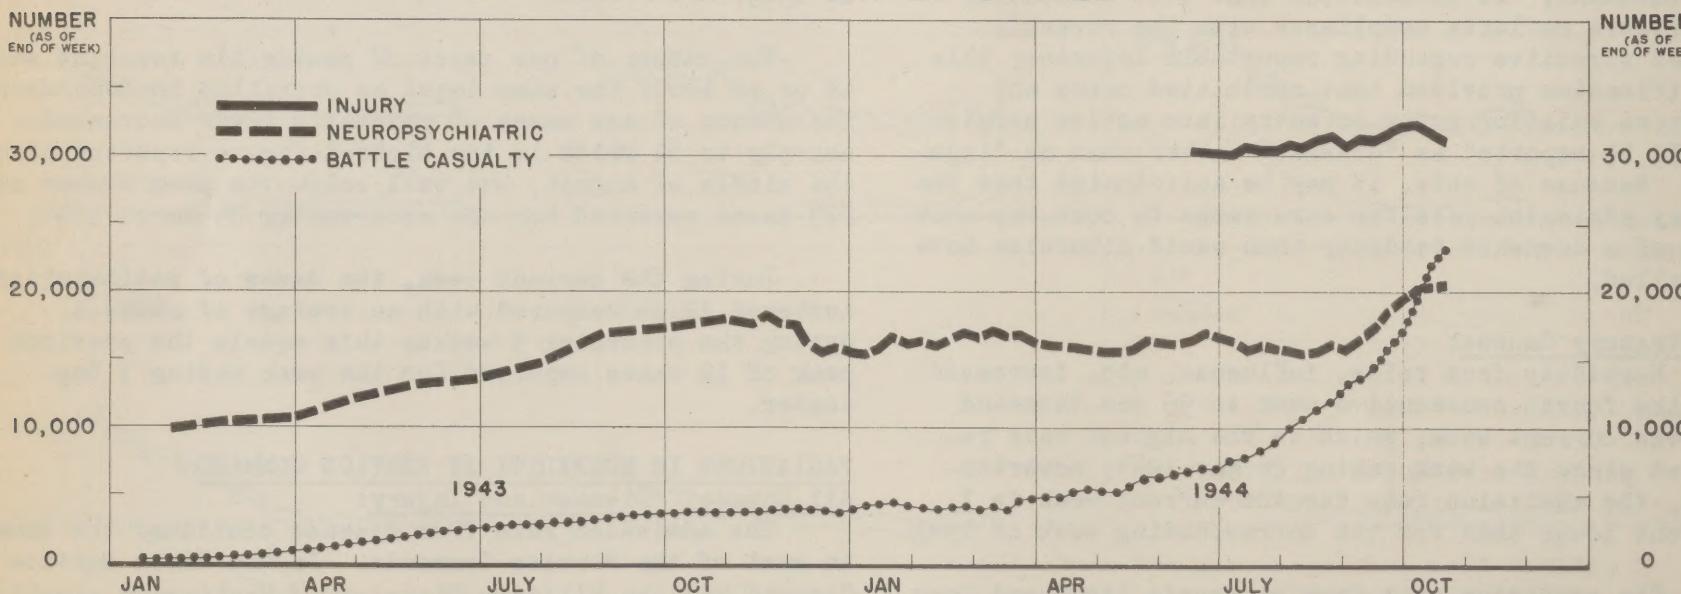

# NON-EFFECTIVE RATE

## CONTINENTAL UNITED STATES

# PATIENTS REMAINING UNDER TREATMENT

## CONTINENTAL UNITED STATES

## COMMENT ON CURRENT TRENDS (CONT'D)

The Second Service Command reported the highest morbidity from all causes (707 per thousand) and from disease (649 per thousand). The lowest morbidity from all causes (519 per thousand) and from disease (447 per thousand) was registered in the Eighth Service Command which in previous weeks had also reported very low morbidity.

Increases in morbidity from injury of 10 percent or more were reported by the First, Second, Fifth, and Seventh Service Commands, while decreases of similar magnitude were registered in the Third and Sixth Service Commands. The Fourth and Fifth Service Commands reported the highest morbidity from this cause (about 70 per thousand), while the First Service Command, with a rate of 52 per thousand, showed the lowest rate (followed by the Sixth and Seventh Service Commands and the Military District of Washington with rates of about 55 per thousand).

Respiratory Causes:

The admission rate from colds, influenza, etc. increased significantly (by 10 percent or more) in the Third and Seventh Service Commands. Sizeable decreases were reported by the First and Sixth Service Commands and the Military District of Washington.

The Military District of Washington reported the highest morbidity from colds, influenza, etc. (155 per thousand) followed by the Second Service Command (144 per thousand). The Fourth and Eighth Service Commands, with rates of about 82 per thousand (or 5 percent greater than in the previous week), reported the lowest morbidity from these causes.

Morbidity from pneumonia remained about the same in most Service Commands; however, significant increases did occur in the Fifth, Sixth, and Eighth Service Commands. The Sixth Service Command, with a

rate of 19 per thousand or more than double that for the country as a whole, reported the highest morbidity from this cause.

Common Communicable Diseases:

Morbidity from "new" venereal (excluding EPST) cases increased sharply in the Fifth Service Command and the Military District of Washington. As a result, the Fifth Service Command reported the highest morbidity from these causes (69 per thousand) followed by the First and Second Service Commands with rates somewhat in excess of 55 per thousand. The high experience of the First and Second Service Commands is due in part to the presence of task force troops not under the jurisdiction of these commands.

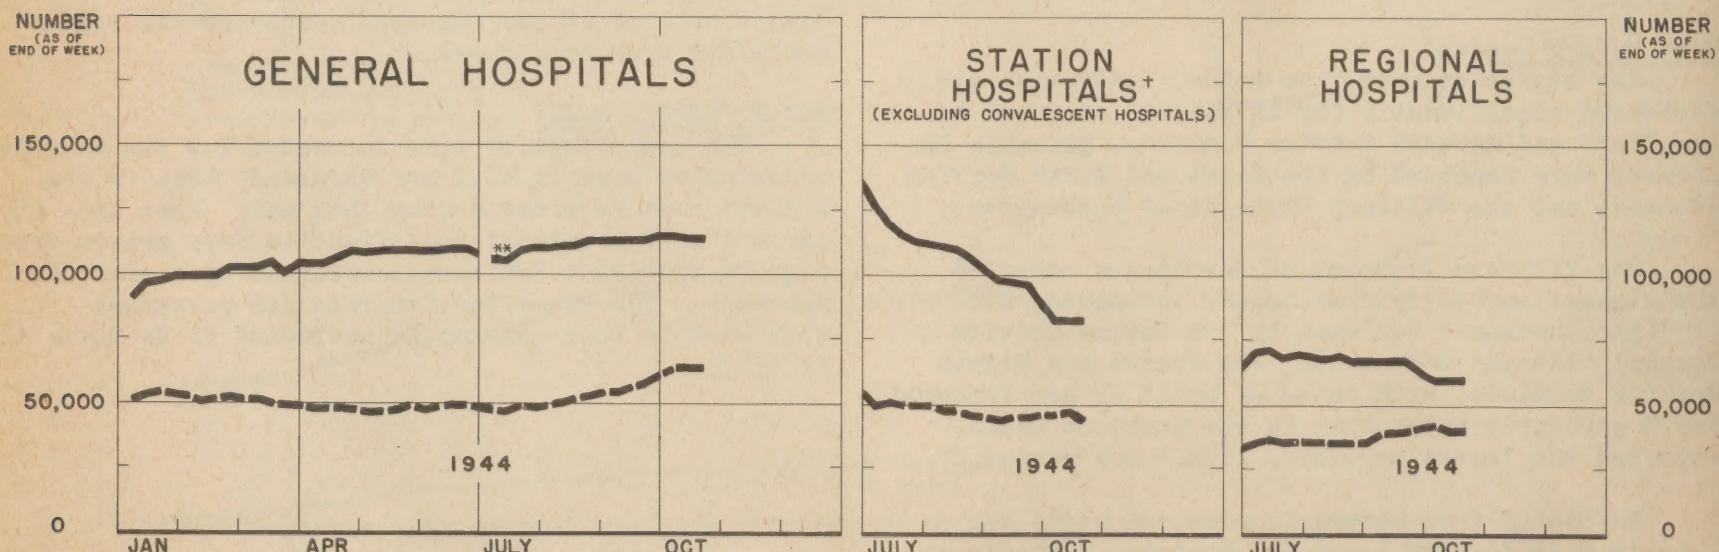

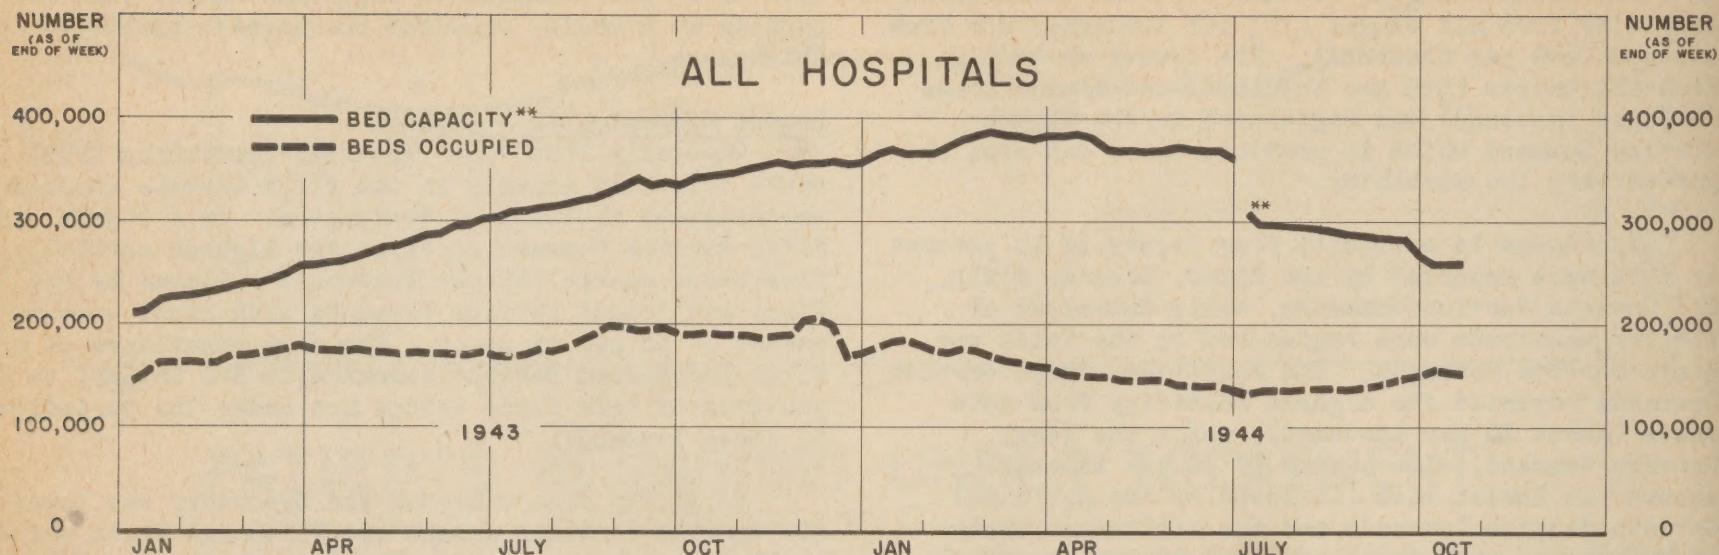

Morbidity from diarrhea and dysentery was lower in all Service Commands except the Fifth and Ninth where small increases occurred. The Seventh Service Command, with a rate of 15 per thousand, reported the highest morbidity from this cause.

NON-EFFECTIVE RATE:

The non-effective rate increased for the fourteenth consecutive week to 48.2 per thousand; this is the highest rate recorded during this war. More than 25 percent of the current non-effective rate arises from days of treatment for cases evacuated from overseas theaters. The non-effective rate for personnel stationed in this country is estimated to be lower than in 1943.

## HOSPITALIZATION DATA\*

CONTINENTAL UNITED STATES

\*EXCLUSIVE OF BEDS REPORTED IN DISPENSARIES, CONVALESCENT FACILITIES, VENEREAL DISEASE FACILITIES, AND COLLEGE TRAINING UNITS.

ARMY SERVICE FORCES, OFFICE OF THE SURGEON GENERAL  
MEDICAL STATISTICS DIVISION, HEALTH REPORTS BRANCH

## COMMENT ON CURRENT TRENDS (CONT'D)

PATIENTS REMAINING UNDER TREATMENT:

The total number of Army patients remaining in hospital at the end of the week represented a rate of 47.3 per thousand strength. The number of neuropsychiatric cases remaining as of 20 October 1944 was reported at 20,383 or about 40 more than the previous week; out of the 20,383 cases 10,268 were in General Hospitals. The number of neuropsychiatric cases remaining was at the highest point during this war.

The number of non-battle injury patients remaining under treatment in hospital and quarters as of 20 October 1944 totaled about 31,000. The number of battle casualty patients remaining increased by about 1,300 to 23,213; all but 377 of these were in General Hospitals.

CERTIFICATES OF DISABILITY FOR DISCHARGE:

During the week ending 20 October 1944 the total number of enlisted men discharged by CDD was 4,959 or about 100 more than the previous week. About 45 percent of these discharges were reported by General hospitals.

Included among the 4,959 CDD's were 1,921 neuropsychiatric cases, representing 39 percent of the total; the number of such cases among the previous week's CDD's was 1,761 or 36 percent of the total.

CURRENT HOSPITAL CONDITIONS:

The total authorized beds in General, Regional, Station, and Convalescent Hospitals as of 20 October 1944 numbered about 259,000 or the same as at the end of the previous week. The total number of beds occupied was 152,000 (or 59 percent of the total beds authorized) which was about 2,000 less than at the end of the previous month.

The total authorized beds in General Hospitals (exclusive of beds in convalescent facilities)

numbered 114,313. The total beds occupied in General Hospitals were 63,719 (or 56 percent of the authorized beds) which was about 100 more than at the end of the previous week and the highest number ever reported.

The bed capacity of convalescent facilities in General Hospitals was 22,002—an increase of about 500 due in part to the initial reporting of convalescent facilities at Madigan G.H. The total beds occupied in such convalescent facilities was 7,192 or 33 percent of the total bed capacity. The above figures include 10,861 convalescent facilities beds (3,520 or 32 percent occupied) at the seven General and Convalescent Hospitals.

On page 27 there are presented summary data on Army and non-Army patients at General Hospitals as of 20 October 1944. Also shown is a subdivision of hospital beds available in General Hospitals.

Station Hospitals (as distinct from Regional and Convalescent Hospitals) reported about 82,000 total authorized beds, while Regional Hospitals reported about 60,000 beds. The number of beds occupied at Station Hospitals was about 45,000 or 55 percent of total authorized beds. The beds occupied at Regional Hospitals numbered about 40,000 or 67 percent of total authorized beds.

Not included among the station hospitals are 13 which are designated as Convalescent Hospitals (ZI). These hospitals reported 3,039 authorized hospital beds (2,505 or 82 percent occupied) and in addition 20,192 beds in convalescent facilities (5,182 or 26 percent occupied).

Twenty-one stations reported more beds occupied as of 20 October 1944 than authorized.

# SUPPLEMENTARY HEALTH REPORT

FOR THE FIVE WEEK PERIOD ENDING 29 SEPTEMBER 1944

## COMMENT ON RECENT DEVELOPMENTS

### NATURE OF THE DATA:

The data of this Supplementary Report, like those of the Weekly Health Reports, have been taken from Forms 86ab rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. However, unlike the Weekly Health Reports which are compiled on the basis of the figures as received, so as to place the information in circulation at the earliest possible time, the figures here presented for the five week period ending 29 September 1944 include the great majority of the corrected reports as well as reports received too late to be incorporated in the Weekly Health Report.

This Supplementary Report covers morbidity and mortality data for all individual stations with a strength of 1000 or over and gives details for admissions from venereal diseases and for neuropsychiatric cases.

Charts showing morbidity trends from all causes, from all diseases combined, from injury, and from colds, influenza, etc. are presented on page 35. Similar charts for specified diseases appear on pages 37, 39, and 41. A chart showing mortality trends is presented on page 43. A summary for the month of the number of admissions and corresponding morbidity rates and of the number of deaths and corresponding mortality rates for the United States as a whole and for the Service Commands is given on page 44. The most pertinent morbidity data for individual stations are presented on pages 47 to 72. On pages 73 and 74 the six stations with the highest rates of admission during the month are shown for each of the morbidity categories considered.

In reading the detailed tables, it should be borne in mind that morbidity (or mortality) rates based on small numbers of cases are not reliable. For this reason the symbol "?" has been placed after rates computed on the basis of 5 or fewer cases. Attention is directed to the definitions of admissions and admission rates and the discussion of the proportion of total Army strength included in the stations covered by this Report as given on page 2. The term "month" in this report is used to denote the four or five week period based on the number of Fridays in the calendar month.

### MORBIDITY FROM ALL CAUSES: DISEASE AND INJURY

Morbidity from all causes and from disease was about 5 percent higher in September than in August. The Navy's morbidity experienced for shore stations in the continental United States has shown a similar increase in September over August. September is the first month since December 1943 to record an increase in admission rates. Since the last peak rate recorded in December 1943, the Army's admission rate from disease has declined about 50 percent, almost entirely because of the seasonal decrease in morbidity from colds, influenza, etc. The September admission rate from all causes (573 per year per thousand strength) while the highest in the last four months was nonetheless almost 20 percent below the rate for September 1943.

The admission rate from injury decreased to 67 per thousand which except for April is the lowest rate recorded this year. Current morbidity from this cause is almost 20 percent under that for the corresponding month of 1943.

## COMMENT ON RECENT DEVELOPMENTS (CONT'D)

The admission rate from disease for the first nine months of 1944 was 578 per thousand or about 20 percent lower than for the corresponding period of 1943. The admission rate for injury for the first three quarters of 1944 was 69 per thousand or almost 20 percent lower than for the same period in 1943.

Higher morbidity from disease for September as compared with August was reported by every Service Command. The largest increases occurred in the Fourth, Fifth, and Sixth Service Commands, all of which showed rises of at least 10 percent in the admission rate.

The Fifth Service Command reported in September the highest admission rate from all causes and from disease (both about 15 percent higher than for the country as a whole). The lowest admission rate from all causes and from disease was registered in the Eighth Service Command (both about 10 percent under those for the United States as a whole), closely followed by the Seventh Service Command. Unlike previous months, there was considerable variation in the admission rate from disease as between Service Commands.

The highest morbidity from injury was reported by the Fourth Service Command (74 per thousand), closely followed by the Fifth and Eighth Service Commands. The lowest admission rates were recorded in the Sixth Service Command and the Military District of Washington, both of which had rates somewhat less than 50 per thousand.

RESPIRATORY DISEASES:

The September admission rate from colds, influenza, etc. was 81 per thousand or about 20 percent in excess of the corresponding rate for August. This is the first month this year during which an appreci-

able increase in morbidity from these causes occurred. Nevertheless, the rate for September 1944 was almost 20 percent lower than for September 1943 and 85 percent under the peak rate of December 1943. Morbidity from these causes during the first nine months of 1944 was about 35 percent lower than during 1943.

Morbidity from colds, influenza, etc. increased by 20 percent or more in all Service Commands except the Fourth and Ninth; the latter reported an increase of about 15 percent, while the former only a fractional rise. The Second Service Command again reported the highest morbidity from these causes (120 per thousand), while the lowest rate occurred in the Eighth Service Command (68 per thousand).

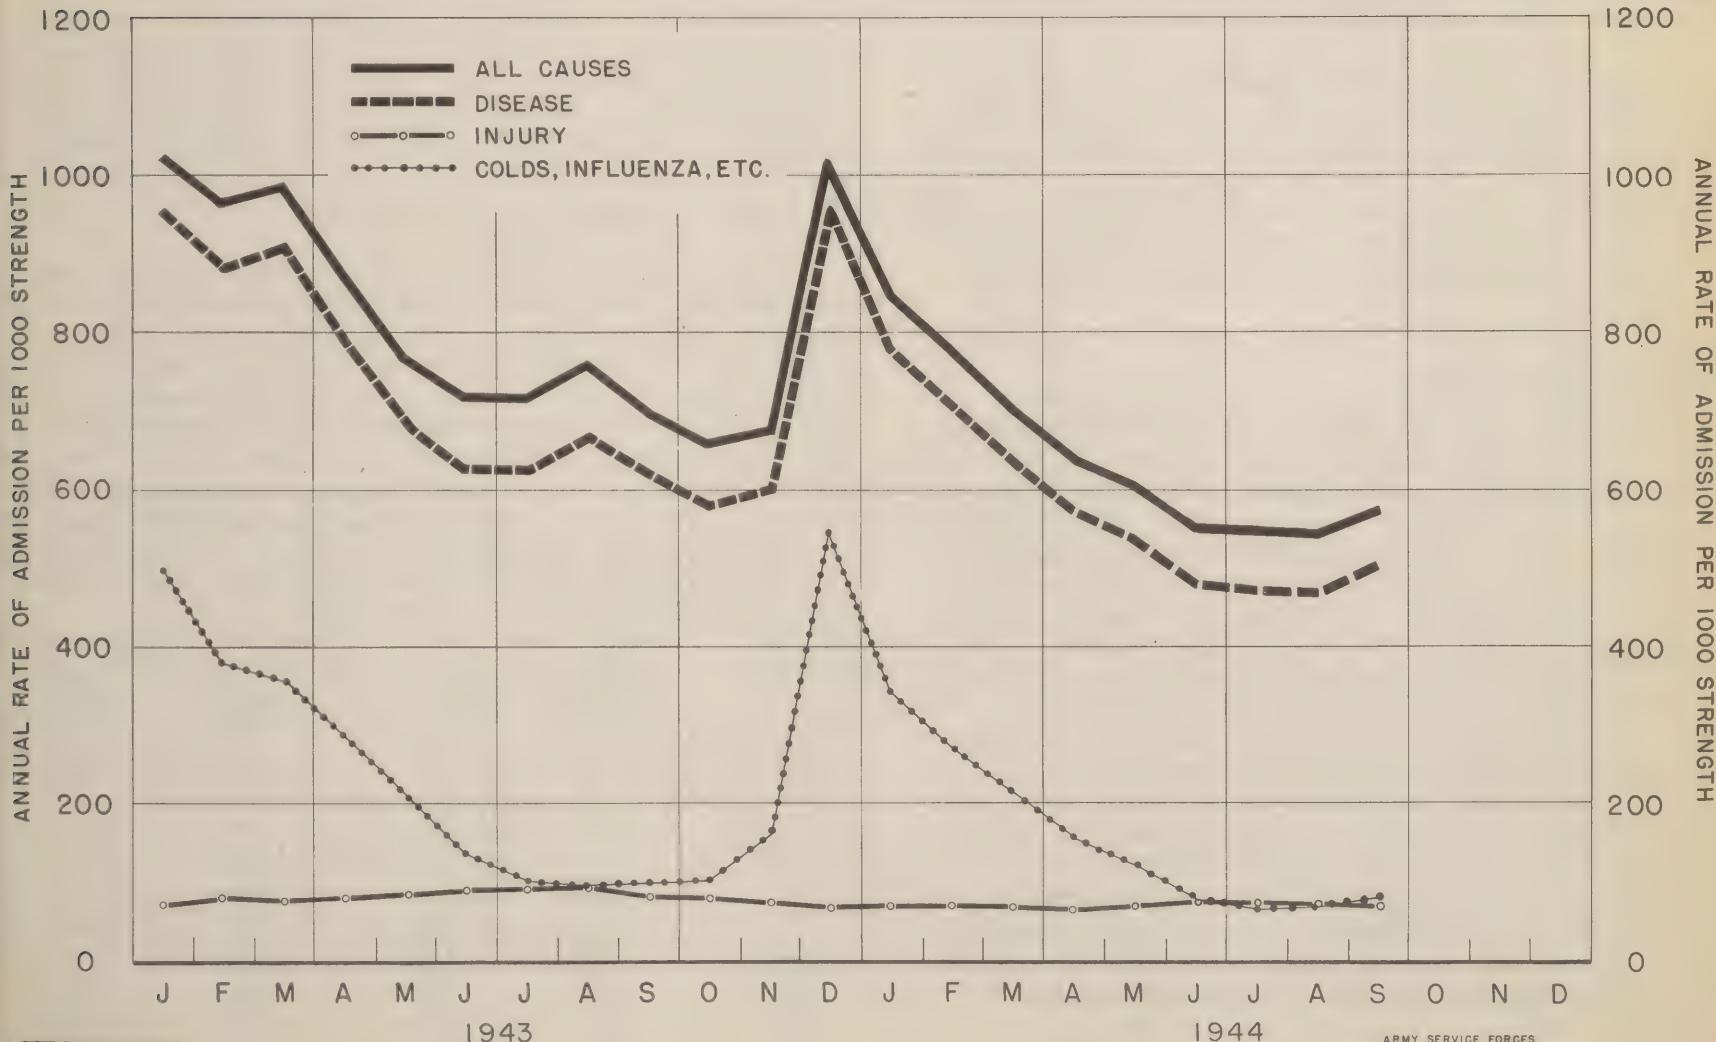

Morbidity from all forms of pneumonia increased by about 10 percent from the minimum rate for this war recorded in August. This is the first time this year that the admission rate from this cause has turned upward, but nonetheless, it was about 20 percent lower than for September 1943. Morbidity from pneumonia for the first nine months of 1944 was at a rate of 12.4 per thousand or about 25 percent lower than for the same period in 1943.

The Sixth Service Command continued to experience by far the highest morbidity from this cause; the September admission rate in this Service Command was about 25 percent higher than in August and almost double the September rate for the country as a whole.

In September, atypical pneumonia accounted for almost 75 percent of the total admissions for pneumonia or a slightly lower proportion than in August. The percentages of pneumonia cases diagnosed as atypical were highest in the Military District of Washington and the Fourth, Fifth, and Sixth Service Commands, in all of which the proportion was 80 percent or more.

CONTINENTAL UNITED STATES

## COMMENT ON RECENT DEVELOPMENTS (CONT'D)

DIARRHEA AND DYSENTERY:

Morbidity from diarrhea and dysentery decreased only slightly in September. In previous years there had been a considerable decline from August to September, but this did not occur in 1944 in part because morbidity from these causes had been at a low level during the summer months.

The admission rate from diarrhea and dysentery for September 1944 was about 30 percent lower than for the corresponding month in 1943. Morbidity from these causes for the first three quarters of 1944 was about 25 percent lower than during the first nine months of 1943. The Seventh Service Command reported the highest morbidity from these causes during the current month.

VENEREAL DISEASES:

Morbidity from venereal diseases, excluding cases contracted prior to entry into active service, increased by about 5 percent in September to 37.4 per thousand which is the highest admission rate from these causes since February 1942. The Navy's experience with venereal diseases was also somewhat higher in September and the highest at least since January 1943. Despite this relatively unfavorable experience from all forms of venereal disease, morbidity from syphilis decreased steadily until June 1944 and has shown only a small increase since. Likewise, the admission rate from venereal diseases other than syphilis and gonorrhea has decreased steadily and during September was at the lowest point reached during this war. The sharp increase in morbidity from gonorrhea has been responsible for the rise in admission rate for all venereal diseases. For the first nine months of 1944 morbidity from all forms of venereal disease, excluding EPTS cases, has been about 20 percent higher than for the same period of 1943.

Markedly higher morbidity from venereal diseases, excluding EPTS cases, was reported in September by the Seventh and Eighth Service Commands; only in the Second and Ninth Service Commands and the Military District of Washington were significant decreases recorded.

The highest morbidity from these causes was reported by the Fifth Service Command, which had a rate more than 50 percent higher than for the country as a whole. Relatively high admission rates were also reported by the First and Sixth Service Commands, while low rates were recorded in the Ninth Service Command and the Military District of Washington.

Morbidity represented by venereal EPTS cases was reported at 8 per thousand during September against 10 per thousand for August. The admission rate from this cause has been decreasing steadily during recent months as a result of the downward trend in the number of men inducted into the Army. Variations in the admission rate for venereal EPTS cases as between Service Commands have relatively little significance, because they reflect a different geographical and racial distribution of Army personnel as compared with that of new inductees.

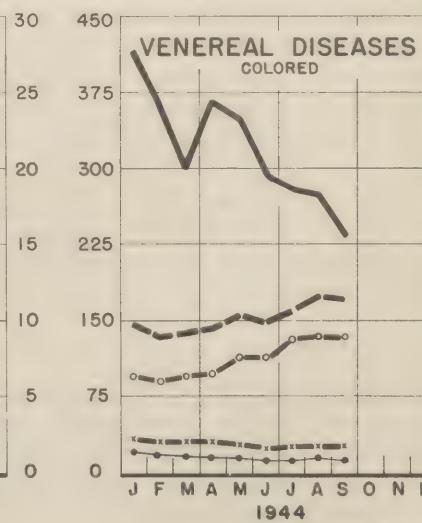

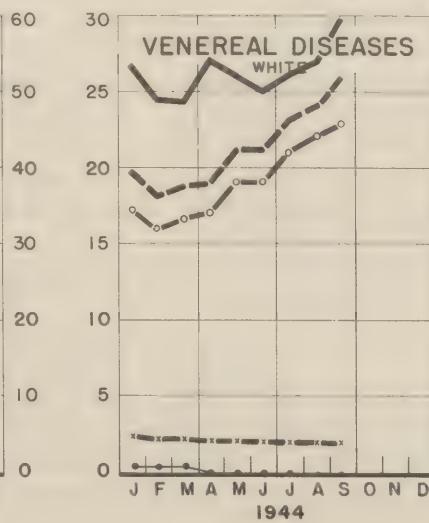

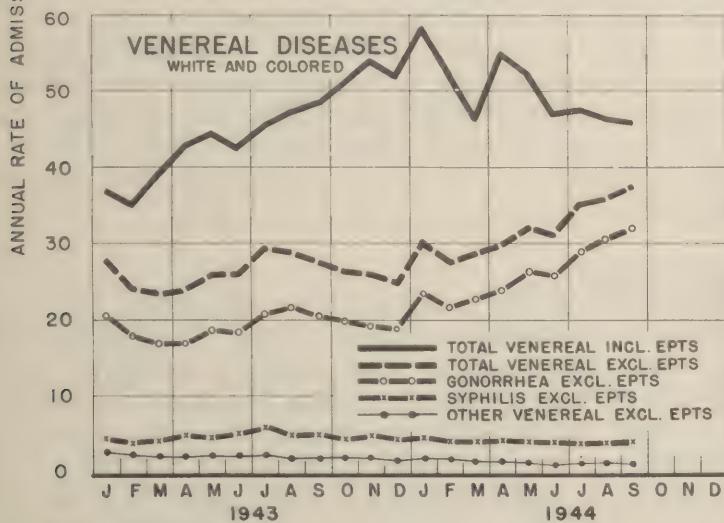

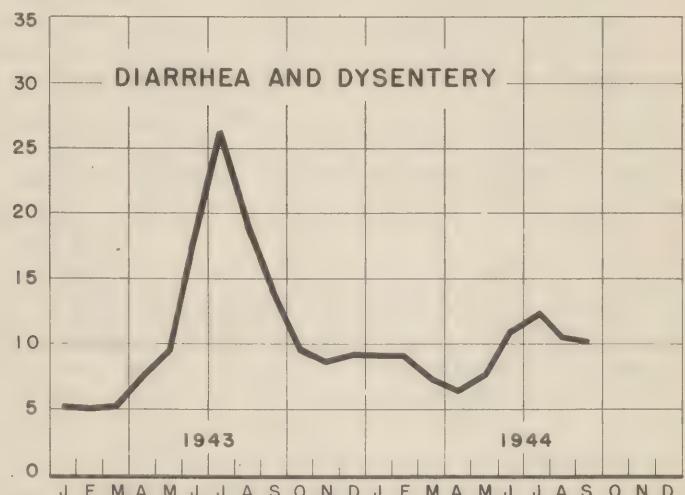

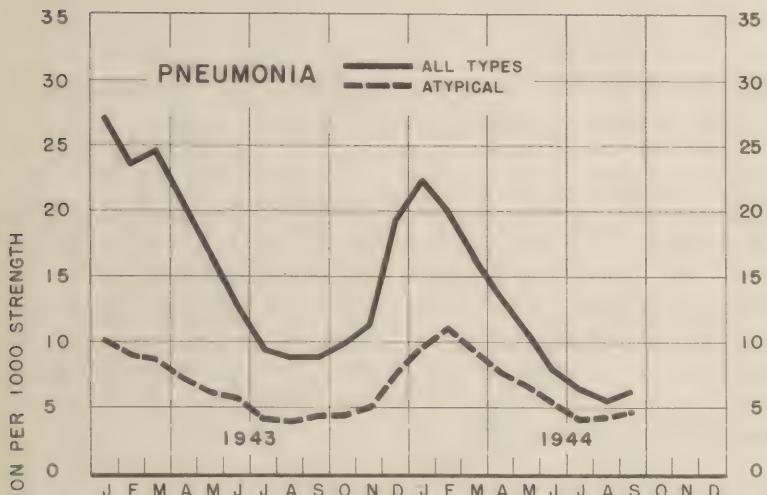

The venereal disease cases remaining under treatment on 29 September are shown below:

Service Command	Number Remaining Under Treatment		Venereal Disease Cases as Percent of all cases	
	Syphilis	Other	Syphilis	Other
TOTAL U.S.	1445	1763	.89	1.08
I	42	38	.9	.8
II	59	83	.5	.7

PNEUMONIA  
DIARRHEA AND DYSENTERY  
VENEREAL DISEASES

## CONTINENTAL UNITED STATES

## COMMENT ON RECENT

The great bulk of the cases remaining were contracted after entry on active service. The number of syphilis cases remaining at the end of September was about the same as for August, while the number of cases of other venereal diseases decreased 9 percent. Total venereal cases represented 1.97 percent of the total number of patients remaining under treatment in hospital. The very much longer duration of hospitalization for syphilis is indicated by the fact that only 11 percent of the total venereal admissions (excluding EPTS cases) were for this cause, even though 45 percent of the cases remaining under treatment were syphilis cases.

The total number of days lost from duty during September because of venereal disease was about 119,000 or an average of almost 24,000 per week; this represented a non-effective rate of .90 per thousand which was about the same as in June, July, and August.

The very much higher incidence of venereal disease among colored as contrasted with white personnel is indicated in the chart on page 37. For colored troops in 1944, morbidity from venereal disease, excluding EPTS cases, has been consistently about seven times as high as for the remainder of the Army, while for EPTS cases the colored admission rate has been about 30 times as high. More detailed data as to the August incidence of venereal diseases by color are presented in the Supplementary Health Report contained in Weekly Health Report No. 38 (page 33).

MEASLES:

Morbidity from measles decreased seasonally to .1 per thousand, which is the lowest level recorded during the current war. For the first 9 months of 1944 morbidity from this cause was about 60 percent lower than during the corresponding period of 1943.

MUMPS:

Morbidity from mumps decreased by about 20 percent

## DEVELOPMENTS (CONT'D)

in September, but remained nevertheless more than five times as high as the rate for either measles or scarlet fever. The September 1944 rate is approximately the same as for the corresponding month of either 1942 or 1943; judging from that experience the admission rate for mumps may be expected to decrease further during the next month. For the first 9 months of 1944 morbidity from this cause was about 40 percent lower than for the same period in 1943.

SCARLET FEVER:

Morbidity from scarlet fever decreased slightly in September and was at a rate of only .2 per thousand. This is believed to be close to the minimum level that may be anticipated for the next few months. Unlike the morbidity experienced from measles and mumps, the admission rate from scarlet fever for the first 9 months of 1944 was only slightly lower than for the first three quarters of 1943.

MENINGOCOCCIC MENINGITIS:

Morbidity from meningitis remained at .3 per thousand during September. This is the same as during the period from September through November 1943 when the lowest morbidity from this cause was recorded in 1943. The admission rate from meningitis for the first 9 months of 1944 was 50 percent lower than for the same period of 1943.

RHEUMATIC FEVER:

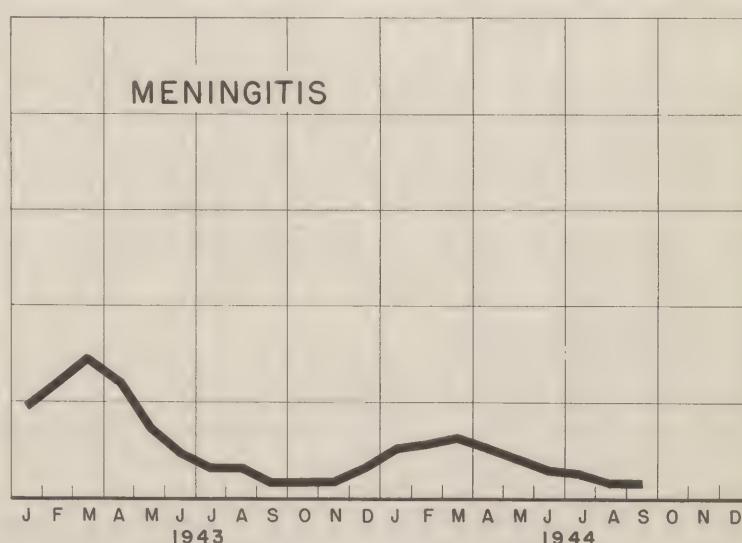

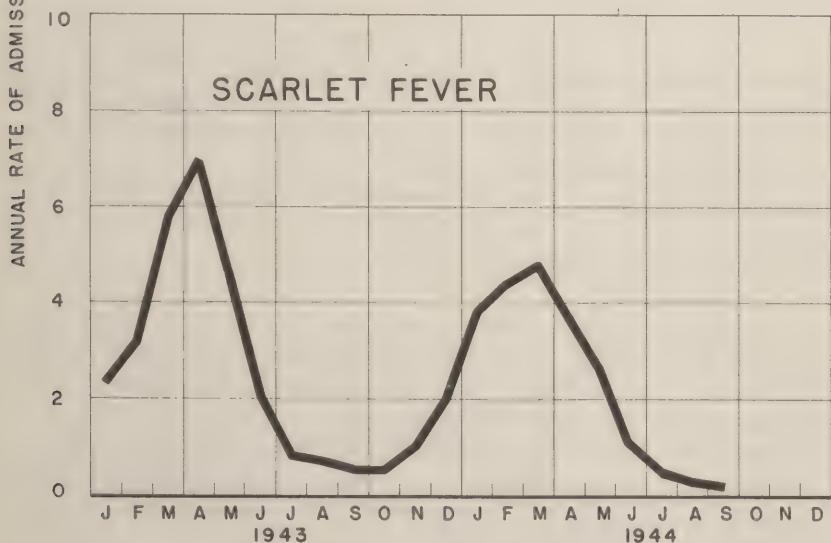

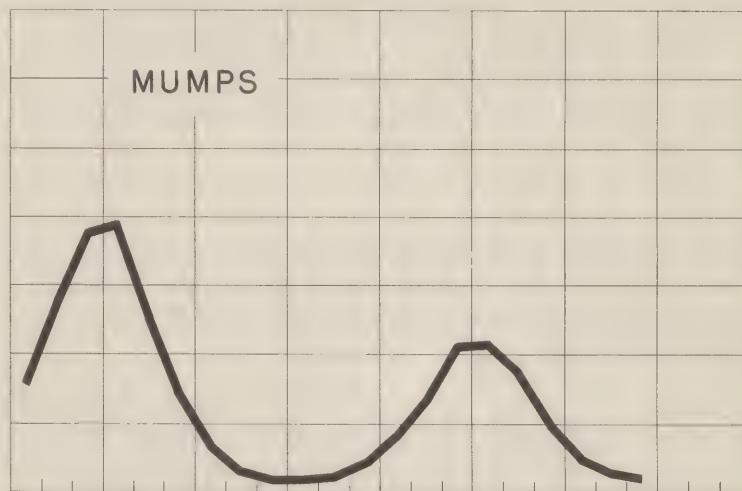

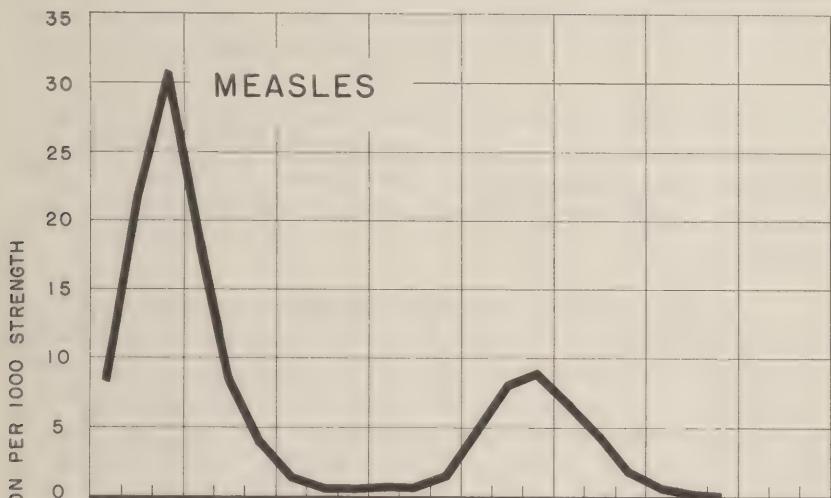

Morbidity from rheumatic fever decreased by about 40 percent in September and was almost 70 percent under the peak rate reported for the period from March to May of this year. Morbidity from this cause is at about the same level as during September 1943 and as low as that registered in any month since January 1943. The Seventh Service Command, with a rate about 4 times as high as that for the remainder of the country, reported the highest morbidity from this cause.

## MORBIDITY FROM —

## MEASLES — MUMPS

## SCARLET FEVER — MENINGITIS

CONTINENTAL UNITED STATES

## COMMENT ON RECENT DEVELOPMENTS (CONT'D)

TUBERCULOSIS:

Morbidity from tuberculosis was at a somewhat lower level during September than in August. As of 29 September 1944 there were 1408 cases of tuberculosis remaining under treatment; these represented .86 percent of the total number of patients in the hospital. Of the 1408 cases remaining, 648 were at Fitzsimons G.H. and 330 at Bruns G.H.; the total at these two hospitals representing almost 70 percent of the 1408 cases.

MALARIA:

Morbidity from malaria acquired in the United States was reported at .2 per thousand or the same as for the previous two months and slightly lower than for September 1943.

The number of cases of malaria presumably acquired overseas which were admitted or readmitted for treatment in hospitals in this country averaged about 860 per week or almost 20 percent above the weekly average for August and by far the highest figure so far recorded.

As of 29 September 1944, there were 2183 cases of malaria remaining under treatment, representing 1.3 percent of the total patients remaining under treatment in hospital (as compared with a revised figure of 2,009 remaining as of 25 August). Only 26 of these 2183 cases of malaria were those where the disease was acquired in the United States.

NEUROPSYCHIATRIC DISORDERS:

The annual rate of admission for neuropsychiatric disorders increased sharply in September (by 25 percent) to 45.9 per thousand; this is the highest rate recorded in the United States during this war. In large part this increase reflects the effects of WD Cir. 370, 12 September 1944, which provided that enlisted men not meeting the minimum standards for induction for whom suitable assignments were not available could be dis-

charged. Increase in the admission rate occurred in all Service Commands except the First, Second, and Sixth, with the sharpest rises occurring in the Fourth, Fifth, Seventh, and Ninth Service Commands. The current admission rate from this cause is about 30 percent higher than that for September 1943 which was the highest rate during that year.

The Fourth Service Command reported by far the highest morbidity from neuropsychiatric disorders (61 per thousand), while the lowest rate was reported in the Sixth Service Command and the Military District of Washington.

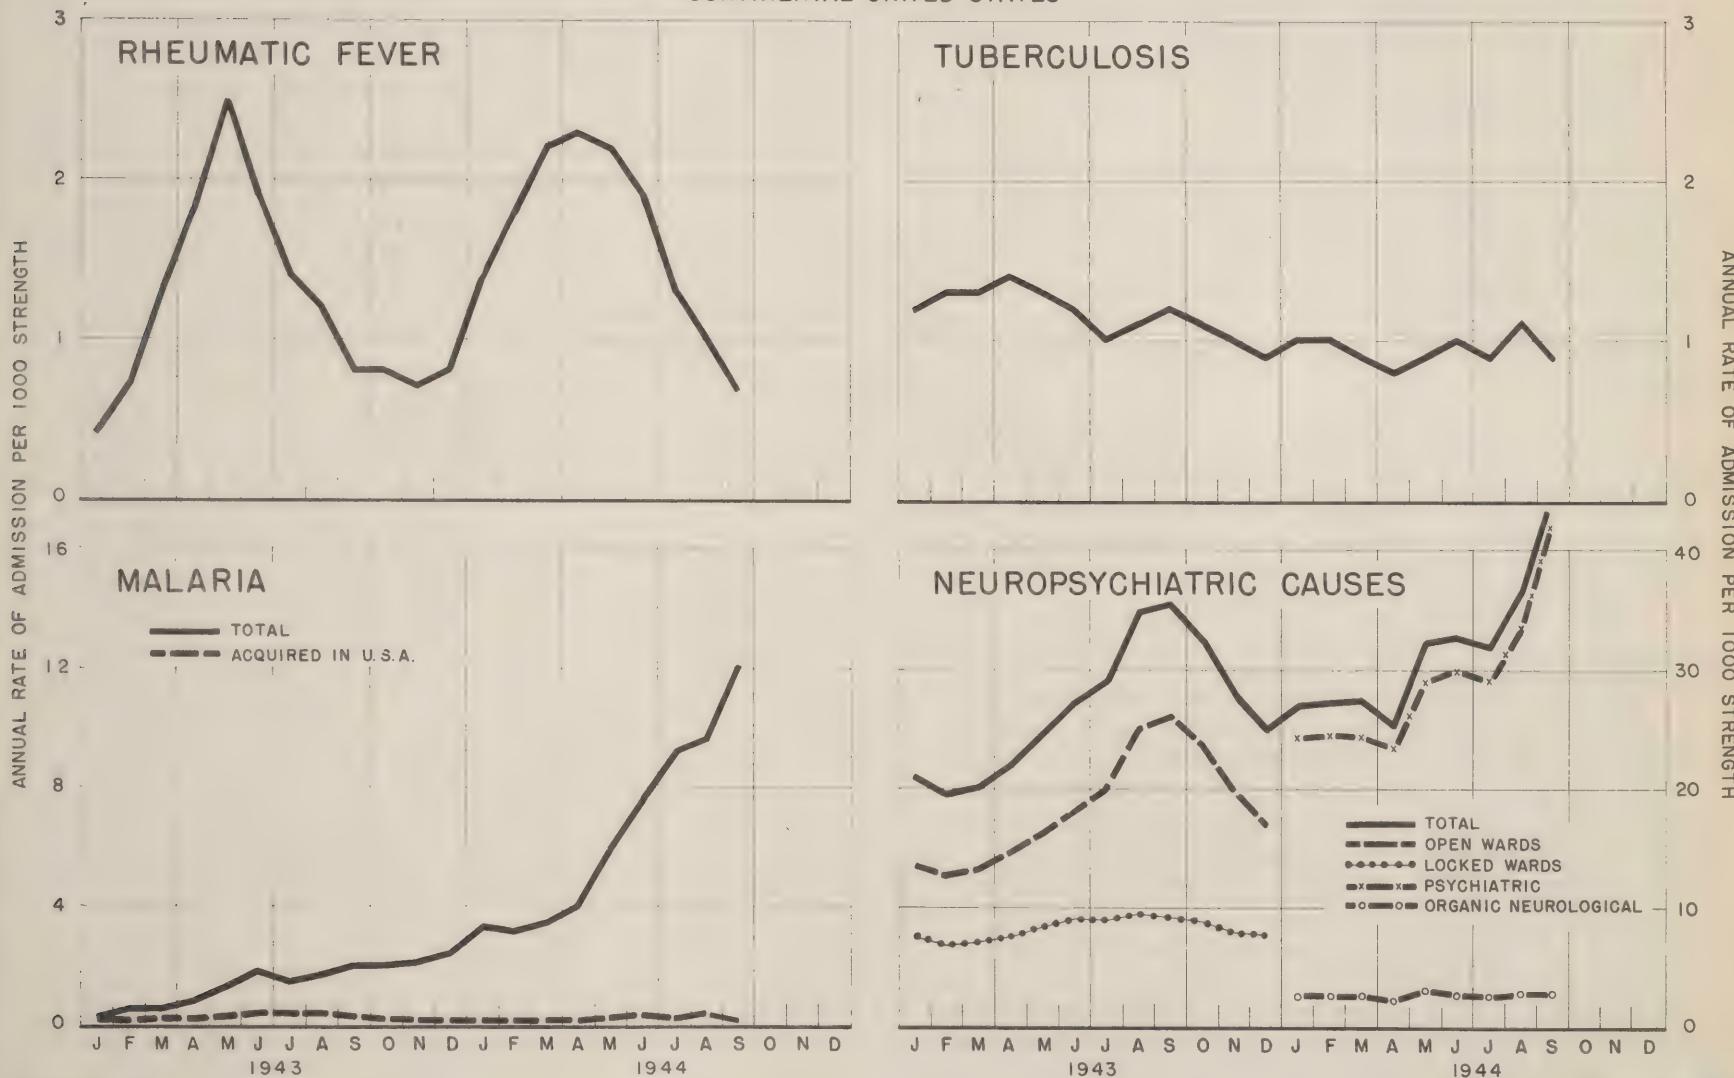

During September there was an average of 1660 CDD's per week given to enlisted men who were classified as neuropsychiatric cases as compared with an average of only about 1400 per week in August. In September the CDD's for neuropsychiatric disorders represented 42 percent of all CDD's, or about the same proportion as for the previous 4 months.

The entire increase in neuropsychiatric admissions was accounted for by psychiatric cases rather than organic neurological ones. As a result, psychiatric cases accounted for 94 percent of the total neuropsychiatric admissions. Organic neurological cases accounted for 10 percent or more of the admissions only in the Military District of Washington and the Fifth Service Command.

The number of neuropsychiatric cases remaining under treatment as of 29 September 1944 was 19,346 or about 3,200 more than at the end of August. Almost all of the increase was accounted for by open ward cases which stood at the highest level recorded so far during this war. Neuropsychiatric cases remaining represented 11.9 percent of all patients in hospital; open ward accounted for 8.8 percent and locked ward cases for 3.1 percent.

# MORBIDITY FROM — RHEUMATIC FEVER — TUBERCULOSIS MALARIA — NEUROPSYCHIATRIC CAUSES

CONTINENTAL UNITED STATES

## COMMENT ON RECENT DEVELOPMENTS (CONT'D)

MORTALITY:

Mortality from all causes during September was reported at 2.22 per year per thousand, or about the same as the rate for April which was the lowest recorded for any month during this war. The mortality rate from disease at .51 per thousand was the lowest registered since November 1943.

It should be noted that reporting of deaths on Forms 86ab is known to be incomplete, especially for deaths from injury for which the understatement may have been as great as 15 percent. The mortality rate from injury when adjusted to allow for under-reporting would be about 1.9 per thousand, resulting in an estimated total death rate from all causes of 2.4 per thousand.

For the first nine months of 1944 the mortality rate of the Army in the United States has been reported at .56 per thousand. The corresponding death rate from injuries adjusted for under-reporting is estimated at 2.15 per thousand, producing a total death rate of about 2.7 per thousand.

NON-EFFECTIVE RATE:

The non-effective rate for September was reported at 41.7 per thousand strength or 9 percent higher than in August; most of this increase arose because of an increase in hospital population at General Hospitals. Despite lower admission rates, the non-effective rate for September 1944 was 9 percent higher than for September 1943; this increase is more apparent than real since it is the result of the inclusion of days lost in General Hospitals by evacuees from overseas, who account for over 25 percent of the non-effective rate. The non-effective rate from injury in September was 8.3 per thousand, which is somewhat higher than in previous months.

Variations in the non-effective rate by Service Command do not reflect so much the variations in morbidity between Service Commands as the varying number of General Hospitals in each Service Command. When comparisons are made between the non-effective rates excluding General Hospitals, the variations in the non-effective rate by Service Command are seen to be very much smaller than when the days lost in General Hospitals are included, as evidenced in the table below:

<u>Service Command</u>	<u>Including Gen. Hosp.</u>	<u>Excluding Gen. Hosp.</u>
TOTAL U.S.	41.7	24.4
